

MoVIZ Data Extraction Workflow v1.1.0

This guide explains how to install the MoVIZ - Data Extraction KNIME extension and import the version 1.1.0 workflow. A [printable PDF version](#) is also available.

What's New

- Easier installation through the MoVIZ - Data Extraction KNIME extension
- Python dependencies packaged with the extension; no separate Conda setup
- Bug fixes for API calls
- Updated and newer LLM options for data extraction

Requirements and Downloads

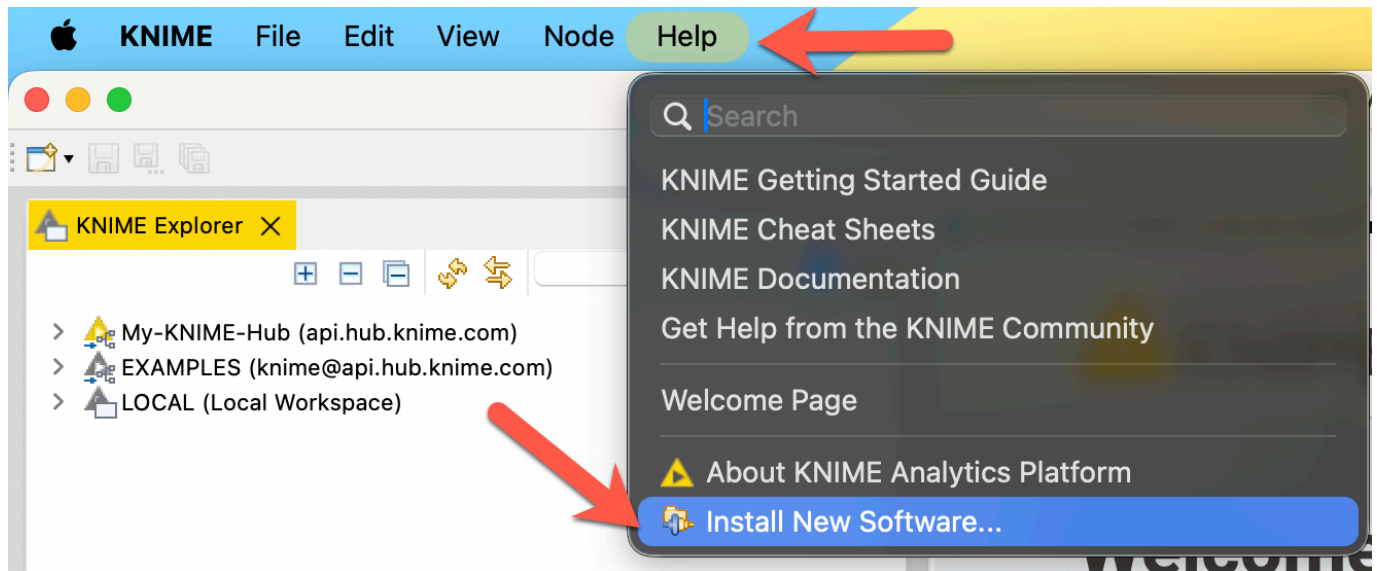

- [KNIME Analytics Platform](#) 5.12.0 or newer
- [Data Extraction Workflow v1.1.0](#) (`.knar`)
- [MoVIZ - Data Extraction Extension v1.1.0](#) (`.zip`)
- [GROBID](#) for the scientific-literature mode only

The extension archive is approximately 2.86 GB and is stored using Git LFS. Use the extension link above rather than GitHub's automatically generated **Source code** archives.

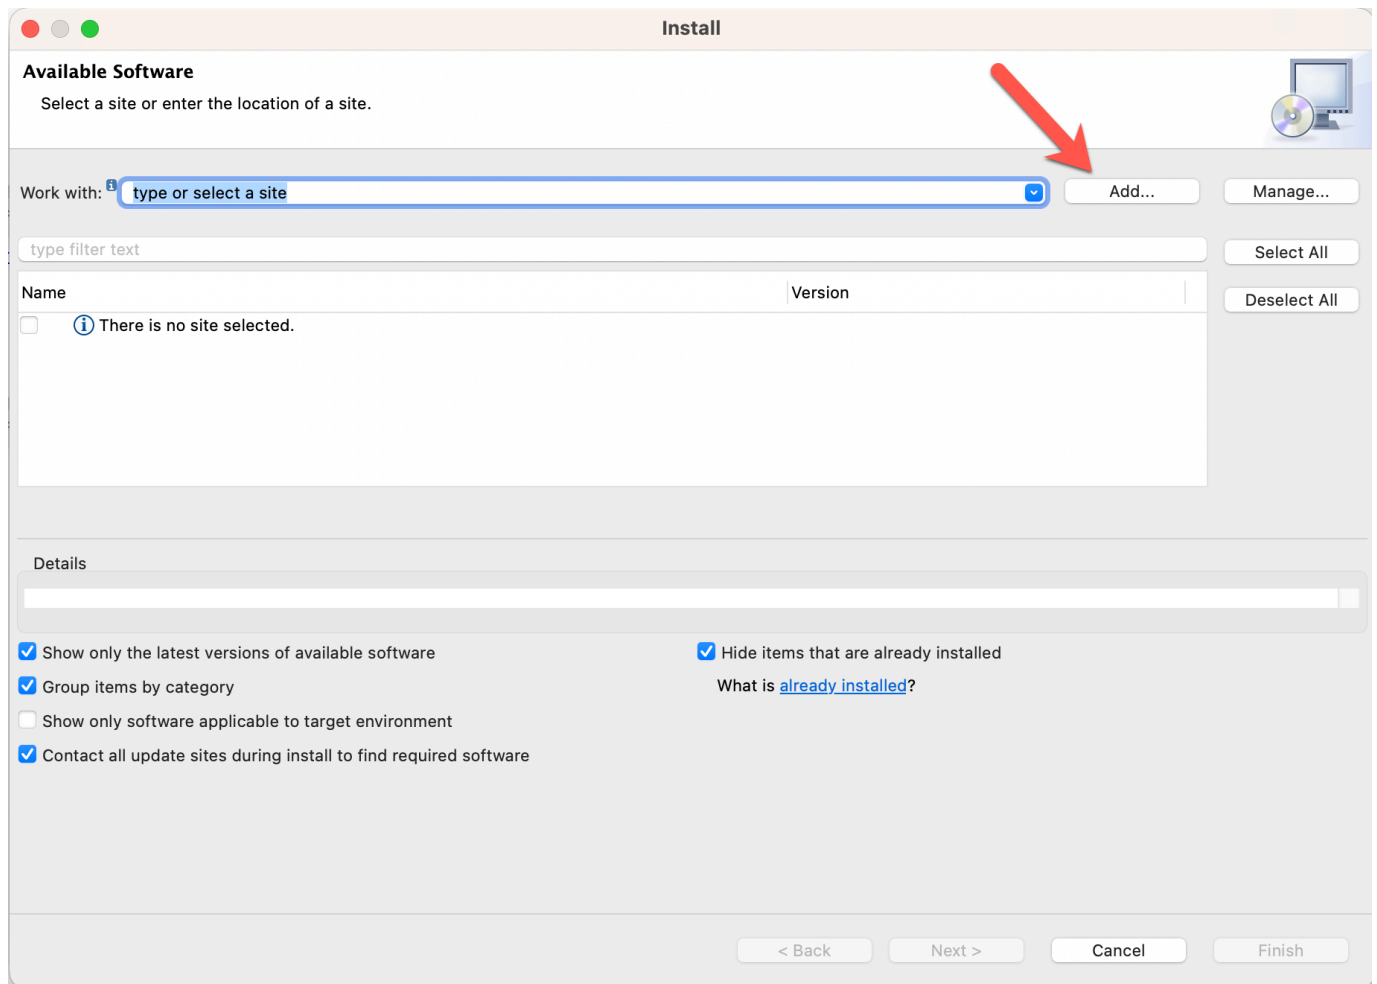

GROBID is not required for the other workflow modes and is not officially supported on Windows. Windows users can skip GROBID and use the remaining modes.

Install the KNIME Extension

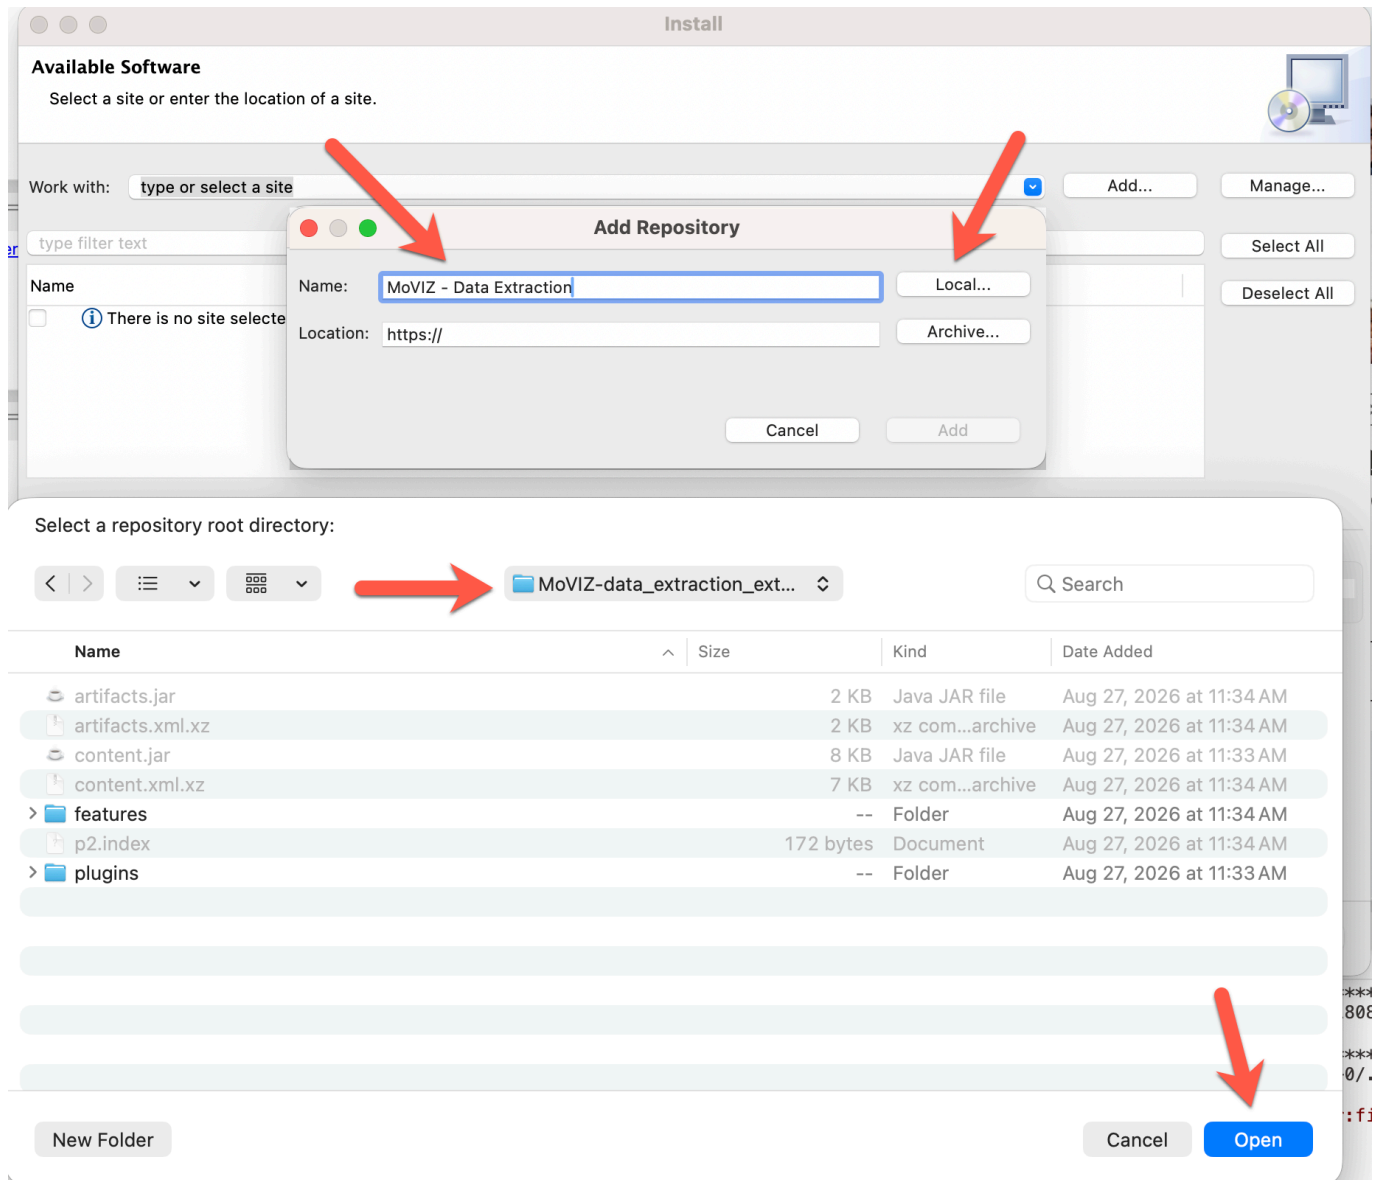

1. Download the [MoVIZ - Data Extraction extension](#).
2. Extract the downloaded archive to a local folder.
3. Locate the extracted folder containing both `content.jar` and `artifacts.jar`. If these files are inside an additional subfolder, use that subfolder in the following steps.
4. Open KNIME Analytics Platform.
5. Select **Help > Install New Software....**

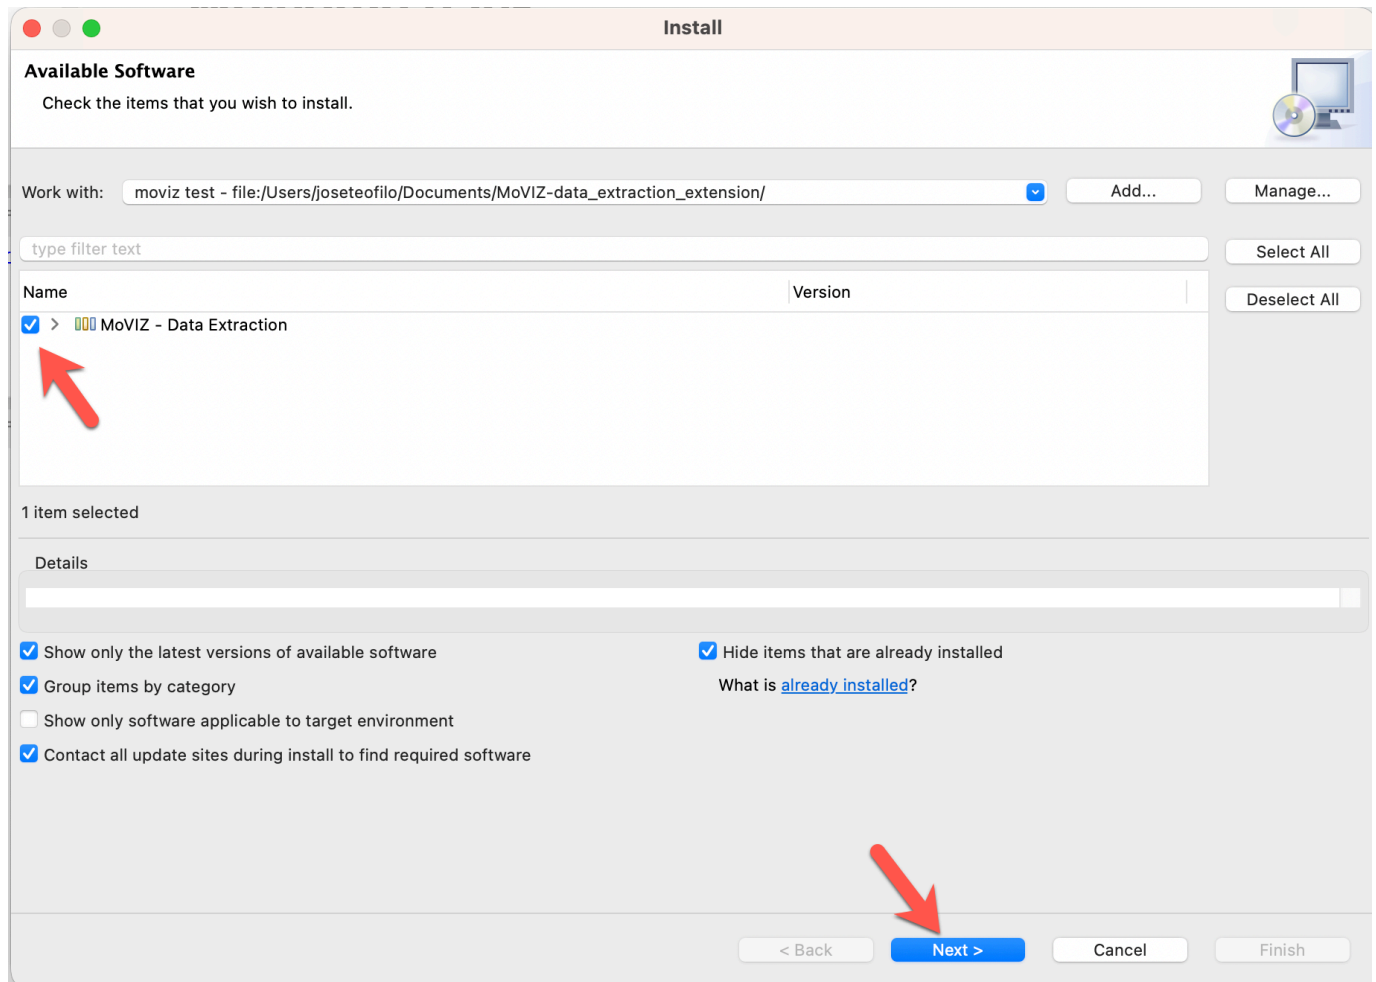

6. Click **Add...** in the Available Software window.

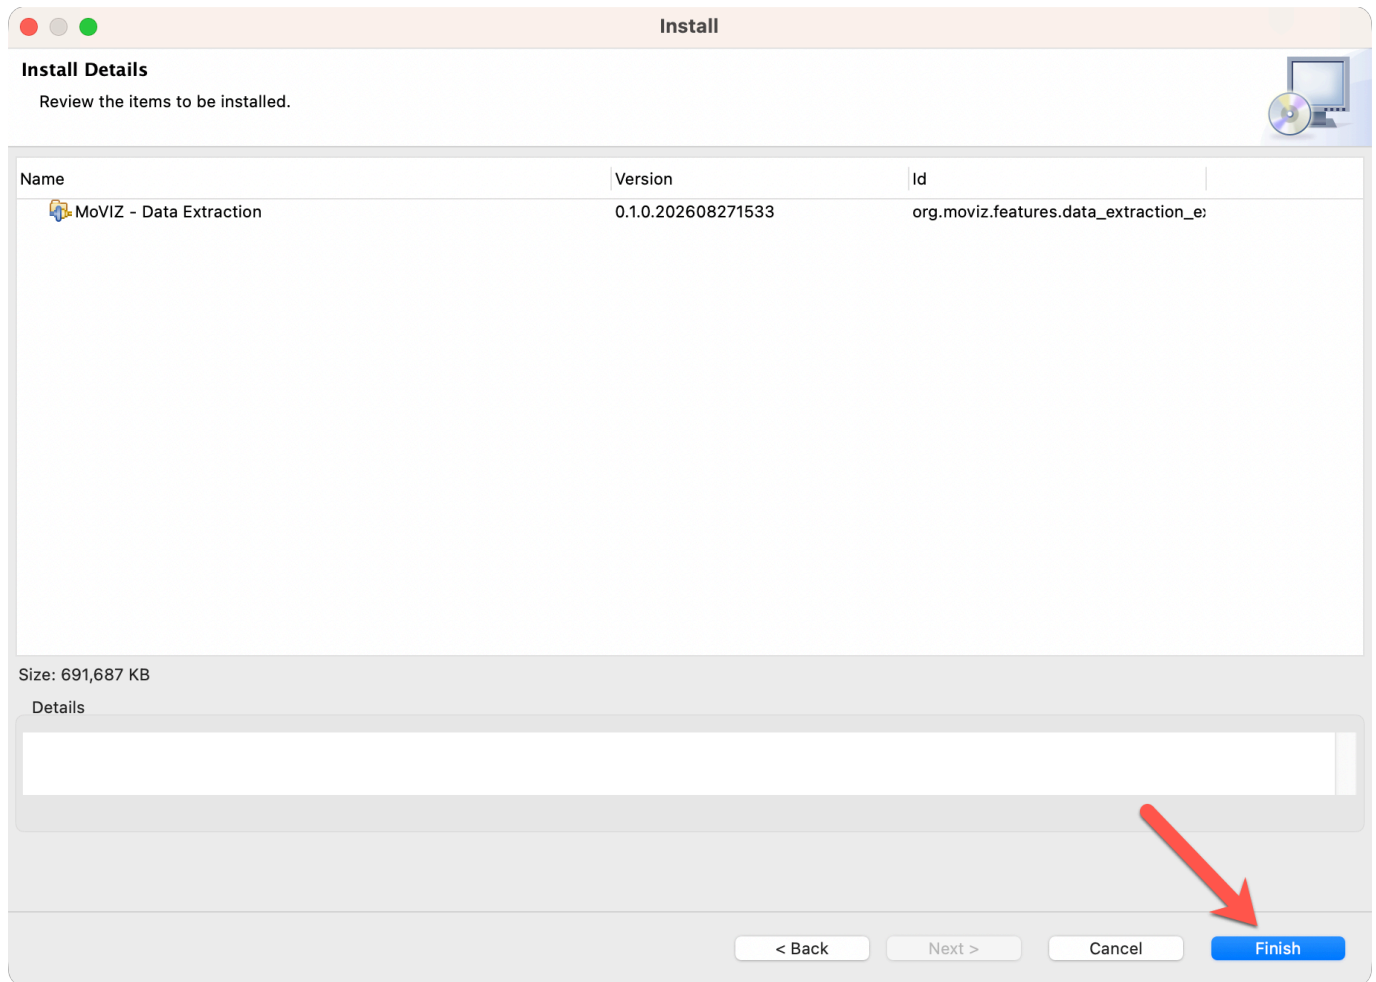

7. Enter a name such as **MoVIZ – Data Extraction**, click **Local...**, select the extracted folder containing **content.jar** and **artifacts.jar**, and click **Open**.

8. Select **MoVIZ - Data Extraction** from the update site and click **Next**.

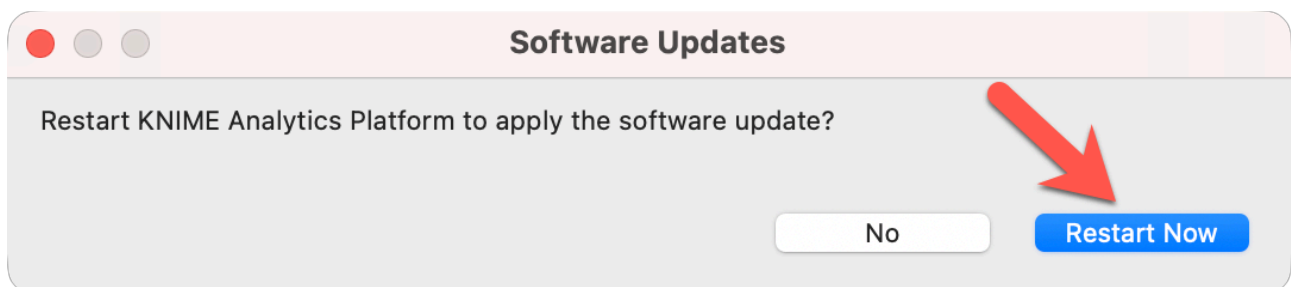

9. Review the installation details and click **Finish**.

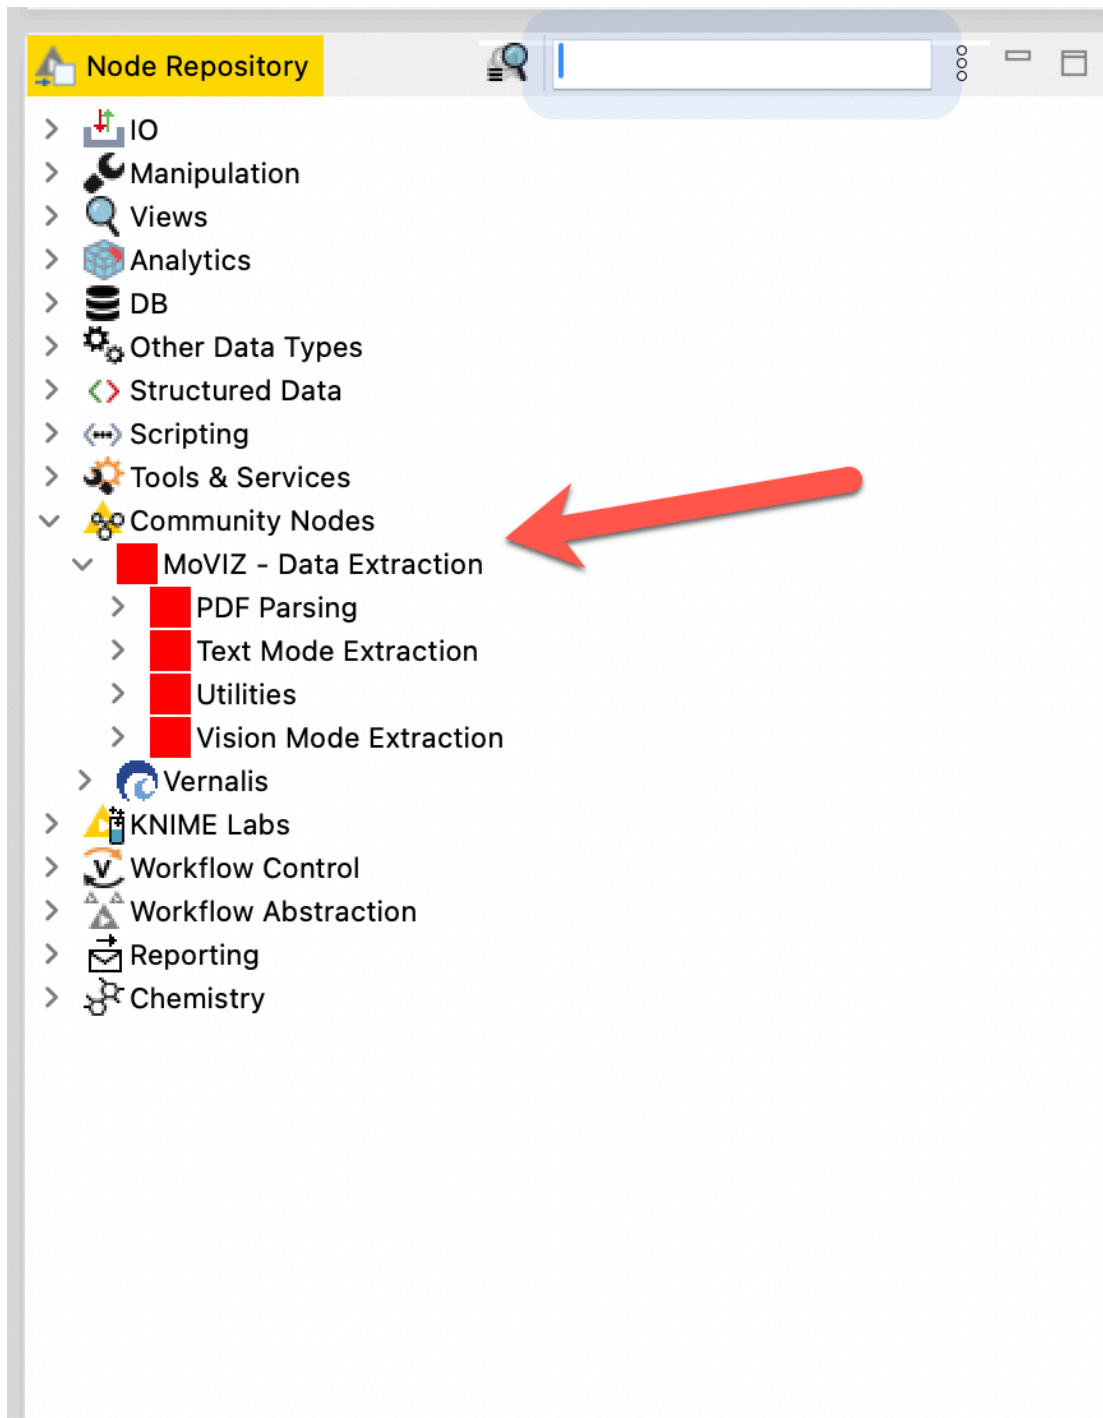

10. Accept the license terms and complete the installation.

11. When prompted, click **Restart Now**.

After KNIME restarts, the nodes are available under **Community Nodes > MoVIZ - Data Extraction**.

Optional: Install GROBID

GROBID is needed only for the scientific-literature mode. For complete details, see the [official GROBID installation guide](#).

1. Install a supported JDK. GROBID 0.8.0 was tested with JDK 11 through JDK 17.
2. Download [GROBID 0.8.0](#).
3. Extract it to a folder whose path contains no spaces.

4. In a terminal, navigate to the extracted `grobid-0.8.0` folder.

5. Build GROBID:

```
sh ./gradlew clean install
```

6. Start the local server:

```
sh ./gradlew run
```

7. Confirm that GROBID is available at <http://localhost:8070/>.

Start the GROBID server before running the scientific-literature mode. See the [GROBID platform notes](#) for Windows-related limitations.

Import and Run the Workflow

1. Download the [Data Extraction Workflow v1.1.0](#).

2. In KNIME Analytics Platform, select your **Local Space**.

3. Select **Import Workflow**.

4. Browse to `Data-Extraction-Workflow-v1.1.0.knar` and import it.

5. Open the imported workflow.

6. If you are using the scientific-literature mode, start the local GROBID server before executing the workflow.

7. Configure the workflow for your data and run it.
